

## SureID Case Study

---

### Jason Roberts Associates

Global SAP consultancy and staff augmentation firm selects SureID-Professional strong biometric authentication to secure remote access to their enterprise.

*“We knew we could increase our sales if we had remote access to our staffing data from anywhere at anytime. Because of security concerns, we have been reluctant to take that step. Finally we found the answer with SureID strong biometric authentication.”*

Robert Kirschner  
President,  
Jason Roberts

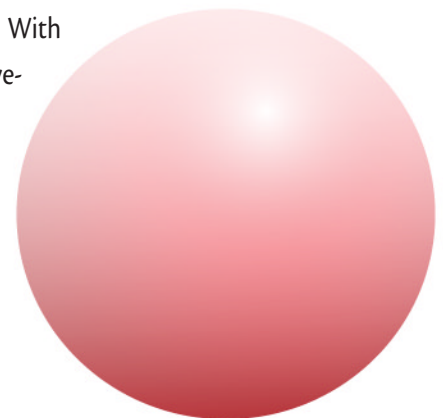

#### Anywhere, anytime with confidence

The business of staff augmentation requires providing the best personnel as quickly as possible, especially when working with global organizations. The ability for Jason Roberts' account executives to work remotely from home, in an airport, at a satellite office or at a hotel has become even more important with the tight economy. Increasing overall revenues while maintaining cost controls requires an increase in productivity. This productivity increase is achieved by providing secure, reliable, and auditable access control to corporate information from anywhere at anytime.

“We looked into hardware tokens and smart cards, but they were too hard to administer and they didn't really tell us who was accessing our information. The only solution that made sense for us was SureID-Professional for Check Point. With SureID-Professional users authenticate using their fingerprint, which guarantees their identity and there are no tokens to administer. This was a simple, easy to use, and very secure solution that met all of our remote access security requirements.” Stated Skip Wilson, Security Director at Jason Roberts.

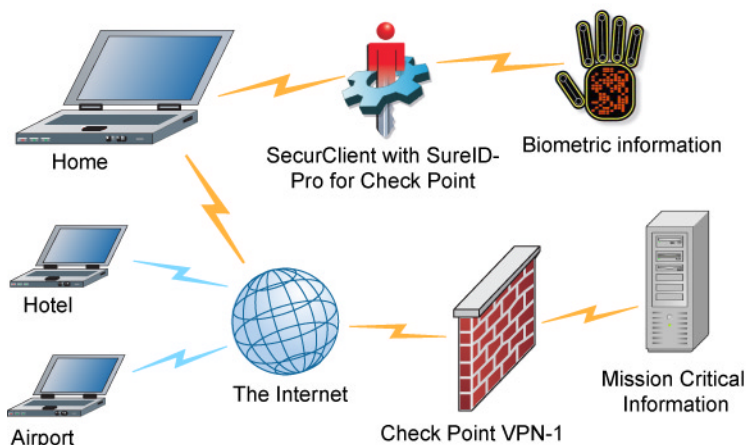

#### Convenient Three-Factor Authentication

Studies have shown that people using two factor authentication methods typically defeat the purpose of the strong authentication for convenience reasons. They tend to leave their “something you have” in the computer and their “something you know” is the same PIN they use for their ATM card. With SureID-Professional you employ three-factor authentication while increasing the convenience to the end user. This has significantly reduced the operational costs related to authentication. A simple presentation of your secret fingerprint provides the strongest authenticated access without entering a password, pin, or plugging in some device that can get lost or stolen.

## SureID Case Study

*“We now have the strongest authentication method where you are the key. I never imagined that I could have a military style strong-authentication solution at a reasonable price. The solution was operational in less than 10 minutes per desktop and required no special training or certification for our IT staff.” - Robert Kirschner.*

### Seamless Integration - Plug and Play

SureID-Professional seamlessly integrates into Check Point's SecuRemote and SecurClient software enabling strong biometric authentication as part of your secure infrastructure. No additional server software or hardware is required and deployment is simple. Just plug-in your fingerprint reader, insert the SureID-Professional CD, follow the simple on-screen instructions, and you are operational within minutes. Because SureID-Professional is Check Point certified, you know that you have one of the most reliable, scalable, and secure solutions available. SureID-Professional does not replace the excellent security standards like IPSEC, IKE, and Digital Certificates provided by Check Point. SureID-Professional simply and reliably eliminates the weakest link in security, user authentication, by replacing authentication with strong biometric authentication.

### About Jason Roberts
