### Improves Security - Eliminate Password Sharing

Passwords are the weakest link in security and are often shared with other personnel, even temporary help. Security policies that require changing passwords on a regular basis are often ignored because of the administrative costs and downtime associated with these changes. Using old passwords and sharing can leave your critical business information open to prying eyes or inadvertent access. SureID authentication eliminates passwords and uses patented biometric authentication as proof of Identity.

### Reduce Help Desk and Administrative Costs

No need to share passwords for temporary access, SureID has advanced access control features that stream-line the identity administrative process while enabling controlled access for consultants or temporary personnel. Passwords cost companies time and resources. Studies have shown that 40% of help desk calls are password related. By eliminated passwords your critical IT staff can focus on more pressing issues.

### Increase Productivity with Single Sign-On

SureID Single Sign-On enhances overall security by automating access to all authorized systems and enterprise-wide applications with a simple touch of your finger. This powerful solution eliminates the need to remember multiple sign on processes, user IDs, or passwords, and improves productivity, profitability and the security of your systems.

### Ease of Identity Access Management

For many companies sharing information has provided increased productivity and profit margins as well as increased risk of inadvertent information exposure. SureID enables controlled access to resources, real-time monitoring, and post access audit to critical resources. Eliminate costly security policy implementations with SureID's automatic policy generator. The SureID intelligence engine learns from normal patterns of use and automatically applies best practices security policies. SureID's patterns of use capability helps efficiently manage resources and identify suspicious usage anomalies.

### About Biometric Identification

Biometric identification is a proven and reliable form of identification. In fact the US military has selected Fingerprint biometrics as the standard means of identification. SureID adheres to this defacto standard and uses patented biometric authentication as the basis for Identity management and corporate information access control. Biometric Credentials, in the form of a mathematical model, are stored in an tamper-proof encrypted container.
